TESTS THAT MATTER

High Sensitivity C Reactive Protein: The actual measurement of inflammation in the artery. This is a test that tells you if you are currently experiencing damage. If it is high we can reduce this to normal with diet and specifically identified nutrients from your laboratory tests.

Homocysteine: Protein coming into the diet requires a large volume of B vitamins and Magnesium to be broken down for elimination. If these nutrients are lacking this artery irritant will build up causing inflammation.

Oxidized LDL: Is the cholesterol stable or is it rancid? Artery cells will take in cholesterol as a food source. This test determines if the cholesterol is safe or not. Typically the cholesterol oxidizes when there is a lack of vitamin C and magnesium.

Running these tests will tell you if you are safe or not. If things are not where they should be we can intervene with targeted nutrients and diet changes.

Repeat testing will give you the feed back on success in stopping arterial inflammation.

PREVENTING ARTERIAL DAMAGE
