

Maybe your are someone who has been told that you are "fine " but still feel bad.

Or maybe you feel you are in perfect health but there is something progressing you would want to know about.

Many problems show up in the blood and other body tissues long before you actually "feel" symptoms. Did you know you can have only 20% liver or kidney function left and still have virtually no symptoms.

Comprehensive laboratory testing which tests blood, hair, urine and stool can give you and your doctor information that can be of greater value than most testing done today.

When testing is done and nutritional and dietary advice is followed progress can be watched without guessing.

Nutritional Laboratory Analysis by Science Based Nutrition

GET THE FACTS.

Laboratory tests and analysis to restore health and prevent illness.

The Process

Step One: A complete health history is taken. You will be asked to complete health surveys and provide your information.

Step Two: At your consultation you can discuss your health issues and decide to have the testing done. You are then given instructions to have your laboratory tests completed. You can check with LabCorp.com to get locations and Lab hours.

Step Three: After the information is gathered you return to the doctor to receive your results in a comprehensive report. This report has valuable information concerning your health that is not frequently provided in any other medical venue.

Step Four: You will be given specific dietary and nutrient recommendations that you do your best to follow.

Step Five: You see your progress upon retesting.

The Science

The Science

No general screening test is more efficient, effective and affordable than a comprehensive blood chemistry panel. It allows the healthcare provider to establish a baseline of biomarkers to track your health and nutritional needs. Getting a blood test is essential to understanding your current health.

The Science Based Nutrition™ program is an innovative, science-based look at nutritional strengths and weaknesses through an individual's blood test and analysis of hair, urine, and stool. This scientific approach can offer a clear plan for your optimum health. - Dr. Van Merkle, D.C., DCBCN, DABCI, CNN, of Science Based Nutrition.

Riffey Chiropractic

The Report

The Report

Upon testing your SBN Analysis Report will also be providing information based on true "healthy normals". You will get information on medications you may be taking and how they may be affecting you. You will also be provided with the customized nutritional supplement program and dietary advice to bring your body back into balance, naturally and safely.

About the Cost

While most wish their insurance companies would cover comprehensive testing and nutritional metabolic rebalancing such as this, they do not. Medical facilities operate within their scope of treatment and do not run testing for natural solution prevention. We therefore do not file insurance for this service.

However, the panels run with SBN are discounted to a great degree. These savings are passed on to you. It is possible that these tests may cost patients less than what their co-pay would be for the same tests run through their medical venue.
